
TGS-1600 TAILGATE SIDE PLATES

If your truck has never had a tailgate spreader mounted on it in the past, it will be necessary to install a set of side spill plates on the tailgate of your truck to keep the material from spilling out the sides of the tailgate when it is open. These spill plates are available from ODB if needed.

The plates are symmetrical so that either plate will fit either side of the tailgate. They should be mounted to the inside face of the tailgate so that they are close to the sides of the dump bed but not touching and in a location in relationship to the floor that insures minimum clearance while allowing full operation of the tailgate. The idea is to prevent as much side spillage without hindering the use of the tailgate.

The plate may be bolted or welded to the tailgate once it is located.
